

DANIEL CARVALHO

Software Engineer

danielcarvalho.wd@gmail.com LinkedIn GitHub Website +351 918989105

PROFESSIONAL SUMMARY

Fullstack engineer with over 7 years of experience. I like picking up a problem that is not fully defined yet, asking the questions needed to understand it and turning it into something that works in production. I have worked on web platforms, mobile apps and backend systems for companies in social commerce, e-commerce and telecommunications. I normally take my projects from start to finish. That means helping define the requirements, brainstorming, designing the solution, making design docs and implementation plans, writing the tests and following it through to release, owning the feature end to end.

PROFESSIONAL EXPERIENCE

Software Engineer | Bloop

SEPTEMBER 2025 - PRESENT Porto, Portugal · Remote

Bloop is a social commerce platform that mixes a social feed with e-commerce and a rewards business model, where users earn cashback for posting about the products they buy. I work across the whole product: mobile app, web, backend services and infrastructure. Built with React Native, Next.js, and C#/.NET microservices on Azure. I work as a fullstack engineer owning features end to end, from the requirements review, system design, implementation plans, pipelines, development, automated tests, manual testing to release.

Mobile & Web Platform:

- Delivered new features for the social feed, content creation, and user onboarding flows using React Native and Next.js
- Rebuilt the complete orders and refunds experience, releasing incrementally behind feature flags to reduce deployment risk
- Implemented product recommendation and search improvements, enhancing product discovery
- Improved performance, navigation, and stability across both the mobile app and the website

Backend & Distributed Systems:

- Designed and built event-driven microservices in C#/.NET and Dapr, communicating through Azure Service Bus
- Built a purchase attribution system spanning the mobile app, website, and two backend services, powering the platform's core rewards mechanism
- Applied the transactional outbox pattern and idempotency keys to guarantee reliable event delivery across services
- Developed services for product data processing, referral rewards, and automated customer notifications, integrating multiple third-party platforms

Platform Modernization & Cost Reduction:

- Contributed to replacing a paid third-party SaaS with an in-house solution, reducing operational costs
- Authored technical design documents used by the team as the implementation reference

AI & Cloud Infrastructure:

- Built a Python service using Azure OpenAI to automatically score user posts for engagement and purchase potential, running daily as an Azure Function
- Wrote Infrastructure as Code (Bicep) for Azure resources including databases, message topics, and serverless functions
- Built an AI catalog cleaner that improved the content quality of our entire catalog, using AI for processing all the metadata of the products

FullStack Developer | Impresa

JUNE 2023 - JULY 2025 Porto, Portugal · Hybrid

Electronic Programming Guide (EPG) Platform:

- In this project I was part of the development of a complex ETL data processing platform built on Python Django, PostgreSQL and containerized with Docker. We used ReactiveX to create asynchronous pipelines to export all the metadata to our clients. The EPG system manages the complete lifecycle of television programming data for major telecommunications providers including Vodafone and NOS.
- Architected and implemented complex ETL data processing pipelines handling thousands of television programs daily for major telecommunications providers including Vodafone and NOS
 - Developed and maintained hundreds of business rules to standardize, validate, and enrich metadata, improving data accuracy by more than 50%
 - Designed and implemented automated workflows for image processing, including background removal, resizing, and standardization, reducing manual processing time
 - Created intelligent content generation tools for sports metadata enrichment, increasing data completeness
 - Worked on the CI/CD pipelines using GitLab
 - Applied SOLID principles and design patterns to create maintainable and scalable code architecture
 - Developed RESTful APIs following industry best practices for integration with multiple client systems
 - Implemented Elasticsearch for advanced search functionality, improving user search experience

WebSig (Geographic IT System):

- Developed a sophisticated web platform integrating maps and coordinates with specialized tools for the cartography team
- Implemented complex geospatial functionality that significantly boosted team efficiency
- Created an intuitive user interface that reduced training time for new team members

Tourism Platforms:

- Built modern platforms and mobile applications for the tourism industry using React Native
- Implemented responsive designs that increased user engagement across platforms

Software Developer | ISSHO Technology

JULY 2022 - JUNE 2023 Porto, Portugal · Hybrid

- Developed a comprehensive 3D platform capable of product configuration, quotation generation, CRM, and BOM management
- Built the core application architecture using PHP and Vue.js, implementing responsive UI components that improved user experience
- Mastered Blender to render client-specific 3D objects with Three.js, reducing visualization time
- Optimized MySQL database queries for improved application performance and response time

FullStack Developer | Pluricosmética

JULY 2020 - JULY 2022 Maia, Porto, Portugal · Remote

- Served as a key member of the E-commerce team maintaining and developing new functionalities for the platform that generated 70% of company revenue
- Enhanced core platform (PHP, JavaScript, jQuery) with new features that increased conversion rates
- Developed numerous pages in the administration area specifically designed for Data Management and Marketing teams
- Created comprehensive reporting tools that improved business intelligence capabilities
- Implemented Docker containerization for development environments, reducing setup time

Web Developer | WeCreateYou

NOV 2018 - NOV 2019 São Félix da Marinha, Porto, Portugal · Hybrid

- Completed 750-hour internship before transitioning to full-time web developer role in this company

EDUCATION

CTeSP Computer Systems and Networks - Instituto Superior Politécnico de Gaya (2016-2018)
Completed Level 5 qualification with final-year internship leading to full-time developer role.

BSc in Computer Science (1st Year Completed) - Escola Superior de Tecnologia e Gestão de Viseu (2014-2015)
Completed first year; relocated for personal reasons before transferring.

Universidade Fernando Pessoa (2012-2013)
CET Sistemas de Informação em Saúde

CERTIFICATIONS & COURSES

SOFT SKILLS

- ✓ Strong problem-solving abilities and analytical thinking
- ✓ Effective time management and prioritization
- ✓ Clear communication with technical and non-technical stakeholders
- ✓ Excellent teamwork and collaboration skills
- ✓ Self-motivated continuous learner

RECOMMENDATION

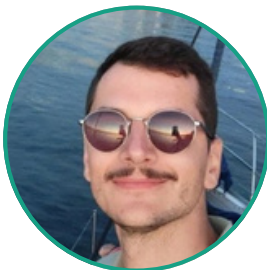

Luis Gestoso Muñoz,
Engineering Manager at Bloop ([linkedin](#))

Daniel is the most reliable engineer we have in the team. You can give him a project described in a few lines, and know that he will ask the right questions to get all the requirements, propose the right tradeoffs to get the best approach for the customer, and design a technical solution that is clean and solves the problem. He will consider different alternatives, and give reasoning into why he thinks the proposed solution is the right one. Then he will break down the project, propose a date, and deliver it before that date comes.

He is also always open to feedback. I have seen him growing month on month, week on week, over the year we worked together. He will take the feedback you give, and take actions to integrate it into his daily flows.

He has proficient use of AI when coding, using it as a tool while he stays in the driving seat. He uses it to deliver faster and make sure everything is covered, but also to debate the solutions before implementing.

On top of all of this, Daniel is a very good, humble guy. The kind of colleague you always want to have in your team. The next team that hires Daniel will be very lucky.

João Neves
Bloop CTO ([linkedin](#))

I had the absolute pleasure of managing Daniel, who stood out as our unanimous top choice among over 400 candidates. When building our engineering team, we prioritized values, principles, and cultural fit above all else, and Daniel was the ultimate proof that we made the right choice. He is an exceptional engineer who brings a rare combination of deep humility, technical versatility, and a remarkably positive attitude. Daniel naturally elevated our team's culture; his great sense of humor, active listening skills, and continuous eagerness to learn made him an absolute joy to work with and a cornerstone of our team's high performance.

Beyond his outstanding character, Daniel is incredibly reliable and thrives outside of his comfort zone. From day one, he was thrown into one of our most complex initiatives, the "Catalog AI" project which required mastering new concepts and technologies with minimal initial support. He embraced the challenge with impressive adaptability, asking the right questions, collaborating perfectly with the team, and consistently delivering high-quality results. If Daniel takes on a challenge, you can rest assured it will be completed successfully. He is a phenomenal asset to any engineering team, and I cannot recommend him highly enough.
